

## Vulnerability Scanning Service

[www.clone-systems.com](http://www.clone-systems.com)

### Detects All Weaknesses in your Infrastructure.

Your business lifeline is your network, and your network is under constant assault. Our suggestion to you is that you retain a service that is aggressive about keeping the bad guys out as they are about getting in.

Clone Systems' Enterprise Vulnerability Scanning Service (CG-EVSS) is tailored for this specific purpose. The scans are performed using our Security Information Portal (SIP), a web-based network evaluation and diagnostic platform, which provides you a powerful and customizable means by which to locate and eliminate all points of potential compromise in your network components and operating environments.

CG-EVSS is available as a yearly subscription service, which accommodates limitless scans within that period.

### Clone Guard® CG-EVSS Solution

CG-EVSS' suite of management features, assessment and diagnostic facilities, executive and technical reporting options, and risk-rating tools are unrivaled. CG-EVSS performs more than 35,000 discreet vulnerability tests. Vulnerabilities are assigned weighted ratings that immediately warn you of potentially critical scenarios. Warnings and alerts will display on-screen depending on the severity level you designate. The vulnerability scanning service is an autonomous environment and requires that no software be installed on any server or client in your enterprise.

### Multi-Vendor Support

### CG- EVSS Features

A cost-effective, meticulous vulnerability scanning solution for all types of network-resident vulnerabilities.

Available on a annual subscription basis; subscription includes all vulnerability updates.

Testing encompasses the following areas:

- Scans by hostname, IP address or network range;
- Supplies login credentials for thorough detection;
- Scans all 65,535 TCP/UDP ports;
- Agent-less scanning technology, no client software to install;
- Network based vulnerability scanning;
- Credentialed based patch audits for Windows and most Unix platforms;
- Credentialed configuration auditing of most Windows and Unix platforms;
- Credentialed security testing of 3rd party applications ;
- SQL database configuration auditing;
- Software enumeration on Unix and Windows; and
- Executive and Detailed Vulnerability Reports;

All testing is done from Clone Systems' web-based Security Information Portal.
