

Managed Firewall Service

www.clone-systems.com

What Makes A Firewall Secure? Diligence.

An effective firewall solution requires much more than the latest tools and security technology. You need professionals on your side who possess the acumen in managing firewalls and keeping them up to date. Most important, you require experts who will perpetually monitor the firewall for suspicious activity that could signal a potential security breach.

Faced with the relentless probing of prospective intruders, nothing less can maintain an effective defense. With a centrally managed firewall solution from Clone Systems, you will find it considerably easier to deploy new applications, which help you increase security and save money in other areas of your business.

In short, we guarantee flawless oversight of your network security.

Clone Guard® CG-MFS Solution

Our strategy for managed firewalls fuses all best-of-breed technology solutions with the able administration of our veteran security team.

Clone Systems has been providing managed network solutions for more than 10 years. Our staff of expert network security engineers can ensure that your enterprise and its infrastructure remain free of the new threats and intrusions being introduced daily on the Internet. Contact a Clone Systems representative about our managed firewall or any other of our many off-site managed security solutions.

Multi-Vendor Support

CG-MFS Features

A managed solution that employs state of the art security technology administered by a world-class engineering team.

Allows focus on your business – All managed firewall logs are remotely accessible through our Security Information Portal. Our engineering team performs all routine maintenance and allows you to focus on your immediate business needs.

Scalability & flexibility – Clone Systems currently manages firewalls for all types and sizes of enterprises. The CG-MFS architecture enables firewall security and compliance to scale alongside enterprises as they grow and change to meet evolving business challenges.

Continuous compliance – Automated PCI DSS assessments, customized audits, and rule history documentation reports can be used to evaluate a firewall's compliance status at any given time.

Customer visibility – On-demand audit reports provide comprehensive visibility and snapshots into firewall management activities, operations, and compliance postures.

Optimization – Detailed traffic analysis reports enable identification and deletion of obsolete and redundant rules, which improves firewall performance and efficiency.

Customer visibility – On-demand audit reports provide comprehensive visibility and snapshots into firewall management activities, operations, and compliance postures.
