

Managed Intrusion Detection

www.clone-systems.com

Making Intrusions a Thing of the Past

How should you secure your network? A large question with no default answer by any means. The proliferation of viruses, Trojans, Denial of Service attacks, buffer overflows, worms, SQL injections, and all their malicious variants leave enterprises relying solely on firewalls as accidents waiting to happen.

Clone Systems, an innovator and leader in network security for more than a decade, includes in its service repertoire a managed Intrusion Detection Service that remotely and transparently monitors all of your network traffic to assure the veracity of your system and each of the files contained on your enterprise. All of this without burdening your data center team with this critical but time-consuming task.

CG-MIDS is truly a unified intrusion awareness and prevention strategy for your network.

Clone Guard® Solution - CG-MIDS

An Intrusion Detection System (IDS) is designed to monitor the effectiveness of control systems by monitoring for evidence of attacks. Intrusion detection measures are often necessary to help control the risks associated with common vulnerabilities such as e-mail viruses, infected laptops and any and all types of human factors. To be effectively implemented, an IDS requires disciplined processes and an expert staff. Our company has been providing managed IDS solutions since our inception in 1998, and our industry reputation for managed services and network security solutions is unsurpassed.

Multi-Vendor Support

CG-MIDS® Features

A powerful and cost-effective means by which to secure all components and endpoints on your enterprise.

Solutions priced from \$525
Includes: hardware, software licensing, management, and maintenance

Directly and effectively addresses common network weaknesses including:

- Weak border security
- Unsecured remote access
- Trusted weakest links
- Overlooked workstations
- Misconfigured publicly exposed services
- Perimeter problems resulting from lack of diligent updating and maintenance

Utilizes the most sophisticated and reliable intrusion-detection technology. Vendor independence; solution are tailored to meet your requirements

Managed Sourcefire® enterprise solutions are available
Real-time Network Intelligence

Real-time detection, response, and escalation of known security threats

Phone support and online chat tools available 24x7x365

Access compliance reports via our SIP web based portal

Security Information Portal (SIP) accommodates real-time security alerts

Detailed logging and reporting of every individual security event.
