One-Stop Network Reporting and Monitoring

Clone Systems' Security Information Portal (SIP) is a web-based network security management dashboard that provides you critical information about all of your managed systems, in real-time. The SIP portal logs all security events, monitors the operation of all network security hardware, generates aggregate security reports, and allows you to initiate on-demand actions like PCI and vulnerability scans or a full-fledged penetration test. Our SIP portal is quickly deployed and affords you unparalleled access to the security profiles being applied to your data.

Our Security Information Portal effectively eliminates all of the logistical difficulties that have plagued off-site managed systems in the past. We will bet that somewhere your system administrator is smiling.

Clone Guard® CG-SIP® Solution

The immediate benefits of having a real-time interface to all of your externally managed network activity are significant. All-hours visibility into network security operations; the ability to address configuration issues and adjust security parameters on the fly; easy report generation for any area of system security; and seamless access to all system and security logs in the event of a failure or intrusion. It is also widely customized for viewing the specific details you wish to monitor, the types of reports you wish to generate, and the tasks you wish to run.

Multi-Vendor Support

CG-SIP® Features

Effectively monitors all security events for the following network-resident components and devices:

- Firewalls
- IPS/IDS
- Web server
- Active Directory controller
- Email server
- Switch logs
- Routers and gateways
- All networked workstations and peripherals

Entirely platform- and vendor-independent, meaning that proprietary components installed on the network will be secured and audited like any others.

Includes a full suite of risk-assessment and workflow tools.

Security events are assigned weighted ratings that immediately warn you of potentially critical scenarios.

Customized reports may be generated against any security area by many different levels of detail. Reports also can be scheduled to be generated at specific intervals or days.
